Manual Testing

What is testing?

It's comparison between Actual value and expected value before develop

the application or software according to customer requirements after develop the application final.

What is software?

A set of executable program and collection of programs in a computer. it's called software.

What is Software testing?

it's a process of executing an application with an intension of finding defect is called software testing.

UNCODEMY

Types of software testing?

manual and automation

What is error, defect and BUG?

we can say that a mistake made by a developer during coding is called a error

an error found during the unit testing/testing in the testing phase is called a defect.

a defect is locked by the tester and verified by the developer is called bug.

What is Failure?

After the development and testing process software or application release in the market then customer face any problem using the application is called failure.

What is Quality?

Customer or client satisfaction in an application is called quality.

What is project?

which is developed for specific client requirement called as project.

What is product?

Which is developed for the entire market requirement called as product. e.g.- yahoo YouTube WhatsApp

What is verification and validation?

verification/static testing- is a process of determining if the software is designed and developed as per the specified requirements.

Validation/dynamic testing- is the process of checking of checking if the software (end product) has met the clients need and expectations.

UNCODEMY

What is Black box testing?

Black box testing involves testing a system with no prior knowledge of its internal working.

A tester provides an input and observes the output generated by the system.

What is White box testing?

The tester is known about the internal design of the application and analyzes it during the testing.

What is Gray Box Testing?

Gray box testing is a mixture of White and Black Box Testing.

Grey Box Testing is a software testing technique to test a software product or application with partial knowledge of internal structure of the application. The purpose of grey box testing is to search and identify the defects due to improper code structure or improper use of applications. In this process, context-specific errors that are related to web systems are commonly identified.

What are Entry Criteria?

1. The **entry criteria** are the conditions that must be met before you can start the test.
2. Entry criteria is a set of conditions that permits a task to perform, or in absence of any of these conditions, the task cannot be performed.

Example of Entry criteria-

1. Verify if the Test environment is available and ready for use.
2. Verify if test tools installed in the environment are ready for use.
3. Verify if Testable code is available.
4. Verify if Test Data is available and validated for correctness of Data.

What are Exit criteria?

1. Exit criteria is an important document prepared by the QA team to adhere to the imposed deadlines and allocated budget.
2. This document specifies the conditions and requirements that are required to be achieved or fulfilled before the end of software testing process.

Examples of Exit Criteria-

1. Verify if the level of requirement coverage has been met.
2. Verify if there are NO Critical or high severity defects that are left outstanding.
3. Verify if all high-risk areas are completely tested.
4. Verify if software development activities are completed within the projected cost.

Difference between SDLC and STLC

1. SDLC is a Development Life Cycle, whereas STLC is a Testing Life Cycle.
2. In SDLC, real code is developed, and actual work takes place as per the design documents, whereas in STLC testing team prepares the test environment and executes test cases.
3. The SDLC life cycle helps a team complete the software's successful development, while the STLC phases only cover software testing.

SDLC Phases-

1. Requirements Gathering
2. Design the software
3. Build the Software
4. Test
5. Deployment
6. Maintenance**.**

STLC Phases-

1. Requirement Analysis
2. Test Planning

3. Test Development
4. Test Environment Setup
5. Test Execution & Closure

Reason behind using the STLC?

1. STLC helps make the testing process easier and more effective.
2. Easy to understand and implement even if the model is expanded to various levels.
3. The requirement of the specific project is measured against the actual result.

Reason behind using the SDLC?

1. SDLC helps you to ensures that system requirements can be traced back to stated business requirements.
2. Development stages go one by one which is an ideal option for the small or mid-sized projects where requirements are clear.
3. It aims to produce a high-quality software system which helps you to meet the customer expectations.

UNCODEMY

What is Requirement Gathering for SDLC and STLC?

1. **In SDLC**, the business analyst gathers the requirements and create Development Plan.
2. **In STLC**, the QA team analyze requirement documents like functional and non-functional documents and create System Test Plan.

Advantages of STLC-

1. Identify the testing technique and testing types.
2. Prioritize the feature which should be primarily targeted on the test.
3. Identify the information about the testing environment where the actual test should be executed.
4. STLC analyze what requirements we have to collected from clients and stakeholders.

Advantages of SDLC-

1. Risk management is low.
2. The project can be completed step by step before another project begun.
3. The structure & functions are well documented.

What are Agile Methodologies?

The Agile methodology is a way to manage a big project by breaking it up into small/several phases.

It involves constant collaboration with stakeholders and at every stage the continuous improvements take place.

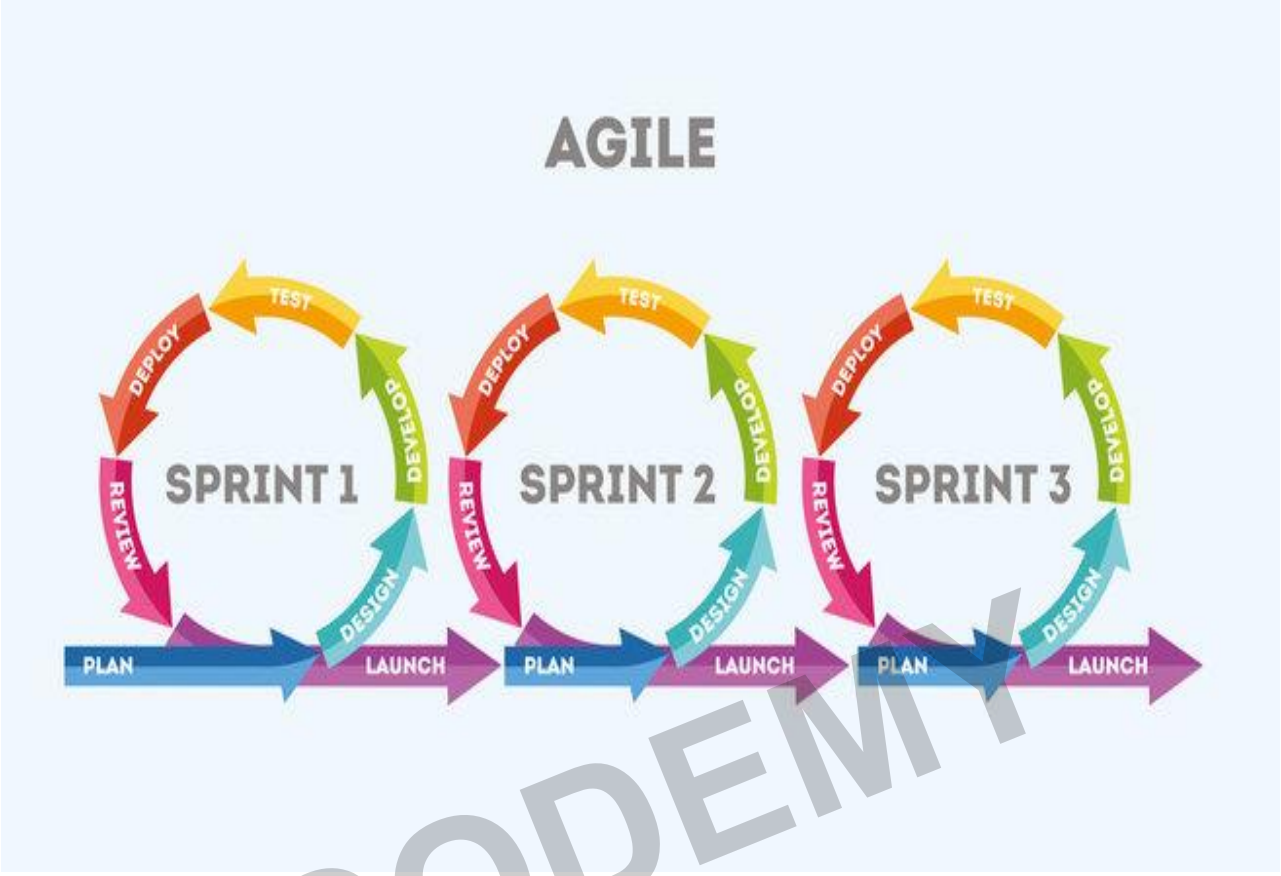

Examples of Agile Methodology-

1. Scrum (Commonly Used)
2. eXtreme Programming (XP)
3. Feature Driven Development (FDD), etc...

Principles of Agile-

1. Business developers and people must work together every day till the completion of the project.
2. Carry out face-to-face conversation within your development team in order to convey information.
3. At regular period of time, the team works on how they can become more efficient, and then simultaneously adjusts and tunes its actions consequently.
4. The prime measure of progress is that the software must be in working condition.

Now Let's talk about very commonly used tool of Agile-

Scrum

scrum has three basic roles,

1. Product Owner
2. Team
3. Scrum Master

The tasks of the traditional project manager are divided amongst these three Scrum roles.

Following meetings of Scrum-

1. Backlog Grooming (i.e., Backlog Refinement)
2. Sprint Planning
3. Daily Scrum (i.e., 15-minute standup)

4. The Sprint Review Meeting
5. The Sprint Retrospective Meeting

What is Backlog Grooming?

In the Backlog Refinement Meeting, the team estimates the amount of effort they would expend to complete items in the Product Backlog and provides other technical information to help the Product Owner prioritize them. (The team should collaborate together to produce one jointly-owned estimate for an item.)

What is Sprint Planning?

The purpose of sprint planning is to define what can be delivered in the sprint and how that work will be achieved. Sprint planning is done in collaboration with the whole scrum team.

What is Daily Scrum?

1. The daily scrum/daily stand-up, also called the standup, is a short daily meeting designed to let the team plan out its work for the day and identify any obstacles that could impact that work.
2. Most teams hold these meetings in the morning and limit them to 10 or 15 minutes.

UNCODEMY

What is Sprint Review Meeting?

1. A sprint review is about demonstrating the hard work of the entire team: designers, developers, product owner, and the testers.
2. In general words, we just see the work of each team member how much milestone they were achieved in this sprint as compare to old one.
3. A sprint review is an informal meeting held at the end of a sprint.

What is The Sprint Retrospective Meeting?

1. The retrospective/retro facilitator (organize by the Scrum Master or Product Owner) is responsible for running the meeting and keeping it on time.
2. Everyone else participates, offering their views on what happened (good and bad) and how the team can improve for next time.

The 3 important questions of the retro meeting are:

1. What did the team do well?
2. What didn't go well?
3. What can be improved?
